

Binary Search Tree (BST) - Theory Cheat Sheet

1. Basics & Concepts

- 1 What is a Binary Search Tree (BST)?
- 2 Properties: $\text{Left} < \text{Root} < \text{Right}$.
- 3 Difference between Binary Tree and BST.
- 4 Time Complexity (Average): Search/Insert/Delete = $O(\log n)$.
- 5 Time Complexity (Worst): $O(n)$ if skewed (e.g., sorted input).

2. Tree Traversals

- 1 In-order (Left $\rightarrow$ Root $\rightarrow$ Right) $\rightarrow$ gives sorted output in BST.
- 2 Pre-order (Root $\rightarrow$ Left $\rightarrow$ Right).
- 3 Post-order (Left $\rightarrow$ Right $\rightarrow$ Root).

3. Operations

- 1 Insertion in BST.
- 2 Deletion (3 cases: leaf, one child, two children).
- 3 Searching an element in BST.

4. Applications & Variants

- 1 Real-world use-cases: Searching, Maps, Indexing.
- 2 Balanced BSTs: AVL Tree, Red-Black Tree.
- 3 AVL Tree: Self-balancing BST using rotations (LL, LR, RL, RR).

5. Advanced/Exam Questions

- 1 Why worst case in BST is $O(n)$.
- 2 What happens if we insert sorted data into BST?
- 3 Recurrence for height of balanced BST.
- 4 Traversal for descending order: Reverse In-order (Right $\rightarrow$ Root $\rightarrow$ Left).

6. Common Interview Questions

- 1 Build BST from array.
- 2 Find min/max in BST.
- 3 Check if a tree is BST.
- 4 Find Lowest Common Ancestor (LCA).
- 5 Kth smallest/largest in BST.

7. Time Complexities

- 1 Search / Insert / Delete:
- 2 - Average case: $O(\log n)$
- 3 - Worst case: $O(n)$ (when unbalanced)

4 Traversal: $O(n)$ in all cases
